

What am I trying to do

- Recreate fl-studio zgamevisualizer (but automatic)
 - i.e, making live music visualizations with computer graphics
 - Shaders are programs that map pixels on screen to colors. They usually have modifiable parameters
 - <https://youtu.be/KLtXvvahR8w?t=11480>
- How are the shaders made?
 - <https://www.shadertoy.com/playlist/NltcWN>
 - <https://thebookofshaders.com/>
- Why?
 - Making visualizations while making music makes things complicated
 - Doesn't translate to live situations
 - The z-game output is just a video, not responsive
 - Alternatives for live situations:
 - Only use spectrograms, not customizable
 - Very old method (windows media player)
 - Not free
 - https://www.virtualdj.com/forums/223454/General_Discussion/Best_visualization_shaders_for_VirtualDJ.html

First Goal: Automatic Visualization with spectrograms

Spectrograms are created with continual **FFT** application

- <https://musiclab.chromeexperiments.com/spectrogram/>

I want to implement something like this in rust

<https://www.shadertoy.com/view/IIb3W1>

Second Goal: Enhance feature detection

- I want to do more interesting feature extraction

- Would like my own code that I can debug and study for better algorithms
 - Better features: Longer term outlook, Detect instruments, etc

Implementation

Audio spectrogram extraction

Listen to an audio stream (microphone) and extract frequency information in near-real time

- Implemented algorithm on pre-recorded sound
- Implemented algorithm on mic input

Visualization

Make visuals that react to sound

- I wanted to use p5.js
 - <https://p5js.org/learn/getting-started-in-webgl-shaders.html>
- p5.js (and other libraries) didn't work out. I decided to use rust
 - How would data sharing work? OSC isn't good enough
 - using just rust seems more sustainable
 - I want to have a deeper understanding of computer graphics
- Decided to use a well documented and low-level graphics library (WGPU)
 - <https://sotrh.github.io/learn-wgpu/>
 - trade-off of extensibility vs ease of use
